

Burndown.pdf

The image above is our burndown chart for Sprint 4.

This Sprint our planning session was better as we did not have to recalculate the story points of many stories. This time we also made sure to set the number of points each story was worth before starting the sprint.

Also, due to the fact that stories did not rely on each other this sprint, nobody had to wait until another story was done to start theirs which made the sprint go smoother. The reason for the very sharp drop at the end was due to external factors like other assignments (A2) being due and all other courses having big projects and presentations due around the end.

Velocity Comparison

In sprint 1, we completed 23 points worth of work.

In sprint 2 we completed 43 points worth of work.

In Sprint 3 we completed 46 points worth of work.

In Sprint 4 we completed 52 points worth of work.

The number of points we completed improved due to the fact that stories did not rely on each other, everyone has much more experience with the stack, and we started earlier than last time. On top of this since it was the last sprint we felt more motivated to try to finish off our entire backlog.
